Video notes: the spreadsheet app is GridCraft (called ExcelCraft in the recording). The PDF preview shows [PrintCraft](#); the launcher directory lists PdfCraft.

Install once. Keep it current.

ArtCraft Launcher manages the suite. Start with one app and check it against your own files.

Get set up

Start with the launcher. Download ArtCraft Launcher from its official Releases page. It provides one place to install, open and update the 12 apps. The launcher is currently early alpha.

Choose your computer. Windows: choose the x64 MSI for most Intel/AMD PCs, or ARM64 for Windows on Arm. macOS: choose the universal DMG. Linux: choose Applmage, or the package matching your distribution and CPU.

Install your first app. Open the launcher and choose the app you want. It selects the matching release package. You can start with one app; you do not need to install the whole collection.

Prefer a standalone download?. Use the Download link beside any app in this guide. Open Assets on its GitHub release and choose your operating system. Source code ZIP and TAR.GZ downloads are for building the software, not desktop installers.

Try your real workflow. Work on copies of your files first. Check opening, editing and exporting before relying on an app for a deadline. These are independent rebuilds; compatibility and feature coverage vary.

Stay up to date

Using the launcher. Open the launcher regularly and check for available updates. It checks GitHub releases, notifies you when versions are available and handles the update packages. Save your work and close the app before updating.

Already installed standalone?. The launcher documentation says it can discover apps installed manually in standard locations. Add the launcher later to manage them. Portable or custom-folder installations may need manual handling.

Updating manually. Visit the app's Releases page, compare the version with your installed copy, and read the release notes. Close the app and run the newer installer. On macOS, replace the app in Applications with the newer DMG copy.

Portable ZIP or Applmage. Download and extract the new portable ZIP into a separate folder, or download the newer Applmage. Preserve any settings kept beside the old app. Confirm the new copy works before retiring the old one.

Update the launcher itself. When offered, use the launcher's Update and restart action. If that fails, get a fresh installer from its Releases page. For individual standalone apps, do not assume a built-in updater unless their documentation confirms one.

BlueBubbles: iMessage on more devices.

Android, Windows, Linux and the web - connected to your existing iMessage account.

A macOS server is required

BlueBubbles runs on your Mac and relays messages to its clients. Keep the Mac awake and online. Apple's iMessage service is still part of the connection.

1. Install the server

Confirm Messages works on your Mac. Download the BlueBubbles macOS server from the official downloads page.

2. Complete the wizard

Follow the official setup guide for permissions, notifications and connection settings. Set a strong server password; keep the pairing QR code private.

3. Connect a client

Install the Android, Windows or Linux client, or open the web client. Follow the connection steps and sync messages.

4. Test your setup

Try a message, attachment and notification away from home Wi-Fi. Check the FAQ for feature compatibility and optional Private API requirements.

REA: investigate, build and test.

Connect Claude Code or Codex to the Reverse Engineer Anything toolkit.

Start with a single feature you want to understand. REA supplies evidence from software analysis; your coding agent uses it to explain behavior and build an implementation.

Set up your agent

Install Node.js and npm first. Supported versions: Node 22.19+, 24.11+ or 26+. Native analysis may need Hopper, Ghidra or IDA; check the installation guide for your target.

[npx rea-agents@latest setup](#)

Select your agent, review and approve the setup changes, then restart the agent.

A focused starter prompt

Use REA to investigate how [one feature] works in [app or local path]. Show the evidence and unknowns first. Propose an implementation for my project at [project path], build it, and test it against the behavior we observed. Ask before installing extra tools or changing system settings.

Keep expectations practical

This is not a guaranteed one-click app clone. Work with software you are allowed to inspect. Model usage and some analysis tools may cost money. ArtCraft and BlueBubbles are separate projects; this guide does not claim they were built with REA.

To refresh agent setup, rerun the setup command above and restart your agent. For a globally installed CLI, follow the repository's update instructions.
